IDT Smart Community Design System

Calm, clean and friendly. A feed-first interface for residents and admins, with generous space, large type and big touch targets. Version 1.0 for the prototype build.

WCAG 2.1 AA Mobile first Desktop 1366–1440

---

1. Color

A harbor-teal primary gives calm and trust. Dusk indigo separates community content from personal content. Marigold is used sparingly for one highlight per screen. Everything else is soft neutrals. Contrast ratios are measured on the listed pairing.

Harbor (primary) #1F6F78 White text 5.9:1 ✓	**Dusk (secondary)** #4A4E9C White text 7.4:1 ✓	**Marigold (accent)** #F2B544 Ink text 9.1:1 ✓
Ink (text) #14262B On Mist 15:1 ✓	**Slate (muted text)** #4A5E63 On white 6.6:1 ✓	**Mist (background)** #F5F8F7
Surface	**Surface 2 / fill**	**Line**

#FFFFFF

#EAF1F0

#D3DFDD
Decorative borders only

Error
#B3261E
On white 6.5:1 ✓

Success
#2E7D4F
On white 5.3:1 ✓

Usage rules

Color	Use for	Never for
Harbor	Main action per screen, active nav, links, own message bubbles	Large background areas
Dusk	Community-wide content tags, admin badges, official announcements	Primary buttons
Marigold	One highlight: “Happening today” or a new-count badge	Text on white, more than once per screen
Error / Success	Validation and confirmation, always paired with an icon or text	Color as the only signal

Dark mode tokens are included in this page's CSS (toggle your device theme). Harbor lifts to `#5CC0C9` and Dusk to `#A9ADF0` for contrast on dark surfaces.

---

2. Typography

Bricolage Grotesque for headlines: friendly, slightly quirky and distinct from generic social apps. **Figtree** for everything else: open, very readable at small sizes. Both are on Google Fonts. Fallbacks: Georgia, system-ui.

Good morning, Priya

Courtyard clean-up this Saturday

Rooftop garden volunteers needed

Join your neighbors on the roof terrace to plant herbs for the shared kitchen. Tools and snacks are provided; all ages welcome.

Style	Font	Mobile / Desktop	Weight	Line height	Tracking
Display	Bricolage	32 / 44	700	1.15	-0.02em
Headline	Bricolage	24 / 30	700	1.2	-0.01em
Title	Figtree	18 / 20	600	1.3	0
Body	Figtree	16 / 16	400	1.6	0
Label	Figtree	14 / 14	600	1.4	0.01em
Caption	Figtree	13 / 13	500	1.4	0.01em

Minimum text size is 13px, and only for captions. Keep line length under 70 characters. Use sentence case everywhere and avoid all-caps labels.

3. Layout & spacing

All spacing uses an 8px scale: `4` · `8` · `16` · `24` · `32` · `48` · `64` . Use 16 inside cards' elements, 24 card padding on desktop, and 32+ between sections. When in doubt, add space instead of a divider.

Mobile (<768)
Screen margin 16 · card gap 12 · card padding 16 · radius 16 · one column

Tablet (768–1199)
Margin 24 · card gap 16 · feed max 640 centered · icon-rail nav

Desktop (≥1200)
Margin 32 · 240px nav · feed 600–680 · 320px right rail · card padding 24

Radius: 12 inputs and images, 16 cards, 999 buttons and chips. One soft shadow only, for floating elements: `0 8px 24px rgba(20,38,43,.12)` . Cards otherwise rely on a 1px line border.

---

4. Components

Buttons

Height 48px, 24px side padding, 16px/600 label. One primary button per screen.

Primary Secondary Tonal Highlight Text

States: Default Hover Active Focus Disabled

Saving

Inputs

Height 48px, 12px radius, label always visible above the field. Outlined is the default; filled is for search and chat.

Cards, chips and tags

Content card

All Maintenance Safety

Community For you Today

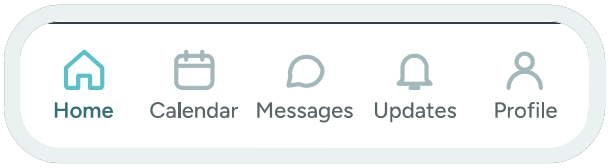

Chips filter (40px tall, 8px apart). Tags label (read-only).

Content card

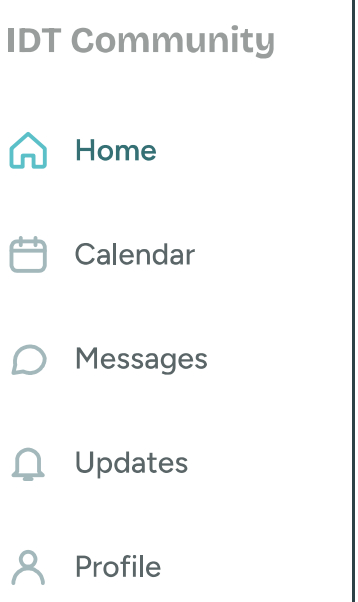

16px radius, 1px line border, 16–24px padding. Image on top when useful; one action at the bottom.

5. Navigation

Same five destinations everywhere: Home, Calendar, Messages, Updates, Profile. Active state is Harbor color plus a bold label and a 3px indicator on mobile or a soft pill on desktop. The shape changes, the logic stays the same.

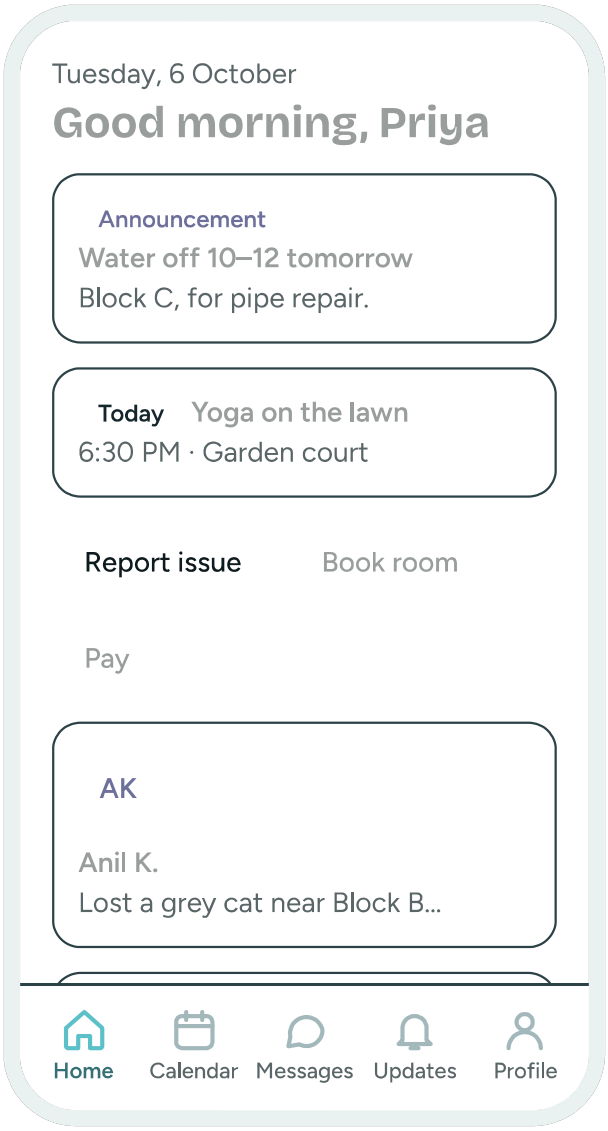

Mobile bottom bar: 64px tall, 24px icons, 11px labels, 48px+ targets

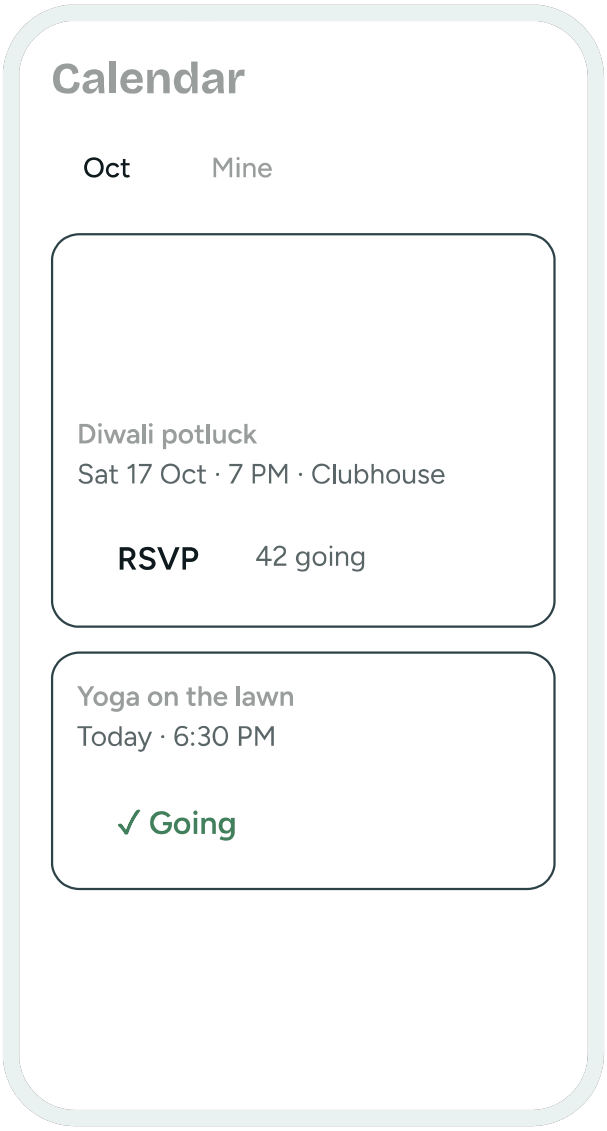

Desktop left nav: 240px at 1366+, 48px rows, icon plus 15px label, pill active state

6. Key screens

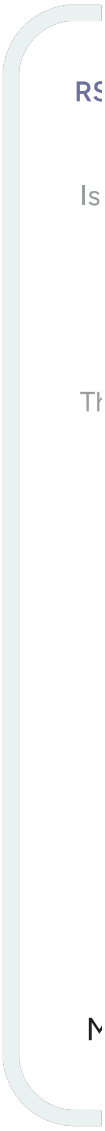

Mock data only illustrates appearance. Scroll sideways to see all six.

Home: greeting, announcement, next event, quick actions, posts, map, news

Calendar: event card with RSVP default and confirmed states

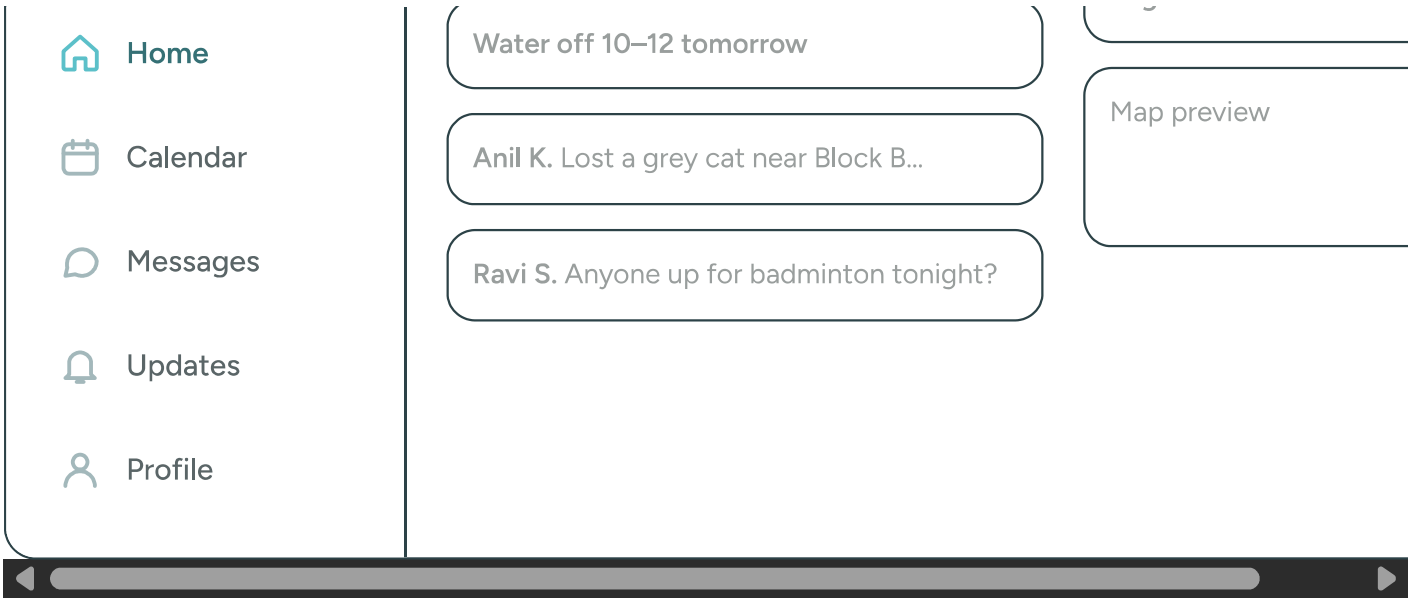

Messag

7. Responsive behavior

Desktop is a re-composed layout. The bottom bar becomes a left nav, the single column becomes a centered feed, and a right rail holds the calendar and map so they are no longer buried under the feed.

Breakpoint	Layout
< 768	Single column, bottom nav, quick actions as horizontal chips
768 – 1199	Centered feed (max 640), 72px icon-only left rail
≥ 1200 (target 1366–1440)	240px labeled nav, 640px feed, 320px right rail, 1280 max container

8. Motion

Motion confirms an action or shows what changed. It never decorates. Animate only `transform` and `opacity`, and honor `prefers-reduced-motion` by removing all movement.

Moment	Behavior	Duration	Easing
Button press	Scale to 0.97	150ms	ease-out
Hover / focus	Background and shadow fade	200ms	ease-out
Card reveal	Fade plus 8px rise, first load only	250ms	cubic-bezier(.2,.8,.2,1)
Page change	Cross-fade, 12px slide on mobile	300ms	ease-in-out

Modal / sheet	Sheet rises from bottom, backdrop fades	300ms	cubic-bezier(.2,.8,.2,1)
Feed scroll	Native scroll, no parallax; skeleton cards while loading	n/a	n/a

9. Accessibility

Contrast
Body text 4.5:1 or better, large text and UI components 3:1. Every pairing listed in section 1 passes AA.

Touch targets
48px minimum for buttons, inputs and nav items (44px absolute floor for compact RSVP). 8px minimum gap between targets.

Focus
3px Harbor outline with 3px offset on every interactive element. Never remove it. Tab order follows visual order.

Meaning beyond color
Errors use text plus a message; status uses a label; active nav uses weight and an indicator.

Semantics
Use `nav`, `main`, buttons for actions and links for navigation. Alt text on informative images, labels on all inputs.

Scaling
Use rem units. Layouts must survive 200% zoom with no horizontal scrolling.

10. Implementation notes

Stack
React + Vite, Tailwind CSS with tokens in `tailwind.config`, Radix UI primitives for modal, tabs and focus handling, lucide-react icons, Storybook for

Tokens
Define colors, spacing, radius and type as CSS variables (see this page's `:root`). Components read tokens only; no raw hex values in component code.

Consistency
Build each component once with variants and states in Storybook before using it on a screen. Review new screens against the spacing scale and one-primary-

the component library.

button rule.

Handoff

Export tokens as JSON, icons as SVG (24px, 2px stroke), and photos as WebP at 1x and 2x. Keep the Figma file's styles named to match the token names.
